

Chapter 8
(Bonus Chapter):
The Winning Formula of
Ooi Teik Bee

8.1 Introduction

The name of Ooi Teik Bee may be new to some of you; he has actually established his reputation in Malaysia stock market through the Yearly Stock Pick Competition, organized by i3investor.com, and for topping the table a few years. In addition, he has been working as a remisier for more than 25 years, and has survived several devastating financial crises, and has helped his clients make lots of money in Malaysia stock market.

Over the past seven years Ooi's personal investments have generated about 2,087% profit for his portfolio. The returns on investment (ROI) of his portfolio over the past seven years were mostly above 20%, except 2018. Below is the table of his portfolio performance. Had anyone followed his stock selections closely, he or she would have made a great fortune out of Ooi's recommendations.

Year	Annual Return	Cumulative Return
2013	+ 104%	+ 104%
2014	+ 61%	+ 228%
2015	+ 129%	+ 652%
2016	+ 22%	+ 817%
2017	+ 87%	+ 1,615%
2018	- 42%	+ 895%
2019 (as of Sep 19)	+120%	+ 2,087%

Table 8.1.1: Ooi's portfolio performance

Apart from providing stock recommendations to his clients, Ooi also helps some of them manage their funds. He had also helped Koon managing some of Koon's money, about Rm 12 million, in 2016, for a year, and he generated about Rm 10 million (or 83.33%) profit for the account Koon entrusted to him.

Some of you may be wondering why Koon let Ooi manage his money whilst he has hit so many home runs and has made so much money in stock investment. The answer is: for insurance purposes. As we have learned earlier that no one is infallible. Koon understands that, just like us, he can make mistakes too. Having Ooi to manage to some of his money is actually of great help to him in minimising loss and maximising gain. Whilst the investing philosophy of Ooi may differ slightly from that of Koon, Ooi's approach actually provides a perfect complement to Koon's method. That is why, even until today, Koon always consults him before buying (and selling) shares. Ooi will highlight red flags, threats which can jeopardise Koon's investments, offer his opinions, show Koon the charts patterns, and support and resistance levels of the stocks, and point out the overlooked areas, where special attention needs to be paid, before Koon places his bets. In other words, Ooi is acting like Koon's sounding board.

Well, the main objective of this chapter is not to promote Ooi's service to you, nor to tell you how spectacular his performance is, but to share with you his winning formula and investing philosophy, which I hope will give you some ideas in selecting stocks, to improve your strategy, and to help you make some money in Malaysia stock market. Of course, if you also find it a sound

investment approach after reading this chapter, but are unable to practice it due to your hectic work schedule, you may engage him to manage some of your money.

8.2 What Makes Ooi So Successful?

The secret recipe of Ooi's winning investments is having a suitable stock selection and investing system, which can help him make money consistently year after year and fits his investment style, and his ability to follow the system religiously.

The system was developed and fine-tuned based on his decades of experience in the stock market. Having survived the three major market crashes enables him to build a robust investing system, which does not only perform well in bull market, but remains profitable in bear market. The model applies both technical and fundamental analyses in picking stocks. Since the system requires companies to pass technical analysis screening process followed by fundamental analysis screening stage to be considered good stocks, those counters selected using the system are not only uptrend stocks with strong momentum, their financials are also fundamentally sound. According to Ooi, the upside of stocks selected using this system is greater than 50%, whereas their risk level is less than 10%. Thus, the system creates plenty of positive asymmetrical risk reward opportunities for him, and allows him to enjoy a higher overall return on investment.

The main drawback of the system, compared to some other trading systems, is that it requires investors to hold those stocks for three to six months. Sometimes it may go beyond twelve months, depending on the price levels of the stocks and the paces of their share price movement. Hour-to-hour and day-to-day price fluctuations are usually ignored since investors using this system only jump on the bandwagon when an uptrend starts, and close their positions when the trend comes to an end. In addition, they find it difficult to predict the movements of share price within a few hours, and to earn enough to offset the trading commissions. That is the reason Ooi always says Rome was not built in a day.

The second element of his winning streak is his ability to follow the system religiously. It is not an easy task. If doing it is so easy, everyone would have made a fortune in the stock market after acquiring the investing rules and model. This is what differentiates Ooi from average investors. Doing so usually requires discipline, right temperament, positive attitude and hardwork. For example, one must be patient to wait for the perfect breakout situation to develop, be able to invest with conviction when the market is quiet, and be willing to spend time studying the businesses of companies at home when other people are having fun with their friends after office hours.

8.3 First Screening Process: Technical Analysis

“For me, technical analysis is like a thermometer. If you are a responsible participant in the market, you always want to know where the market is – whether it is hot and excitable, or cold and stagnant. You want to know everything you can about the market to give you an edge.”

Bruce Kovner

Ooi always says *“Human can lie, but charts don’t lie.”* One of the reasons that the information provided by charts is more reliable than human’s words is that charts are the trails of money movement. Chart patterns can only be formed when there are flows of capital into and out of a stock. And he never takes any CEO’s words for granted, as he knows the words coming out from CEO’s mouth are sometimes not trustworthy, and The CEO can spin a story with which the trend does not in sync. For example, the CEO can tell a very beautiful story of the company’s business in front of journalists, whilst his/her family members, friends and smart money are selling their shares aggressively during the same period of time. When the share price of a stock declines continuously that is a sign showing that the business is facing some challenges or difficulties, and Ooi will immediately remove the stock from his watch list. According to Jesse Livermore, *“often I have observed that the Chief Executive Officer of most companies is little more than a cheerleader, who has only one job with regard to the market. He must assure and reassure the shareholders that everything is fine – if sales are down he tells the shareholders that the decline in sales is nothing more than a slight problem due to some temporary reason. If profits are down he assures the shareholders there is nothing to worry about since the company has already reached and made adequate plans to recapture their profitability.”* That is the reason Ooi always says *“Never trust anyone in stock market, trust yourself only.”*

“Another discipline I learned that helped me determine whether a stock would go up or down is technical analysis. Drelles was very technically oriented, and I was probably more receptive to technical analysis than anyone else in the department. Even though Drelles was the boss, a lot of people thought he was a kook because of all the chart books he kept. However, I found that technical analysis could be very effective. I never use valuation to time the market. I use liquidity considerations and technical analysis for timing. Valuation only tells me how far the market can go once a catalyst enters the picture to change the market direction.”

Stanley Druckenmiller

In addition, chart patterns provide some important information that cannot be obtained elsewhere. Very often share price moves ahead of fundamentals. The reason is that there are always some people who know the news of an important development ahead of us. Paul Tudor Jones once said *“The first thing I do is put my ear to the railroad tracks. I always believe that prices move first and fundamentals come second.”* Moreover, chart patterns reflect the behaviour of market participants. These patterns will repeat over and over again. Experienced chartists who are able to identify chart patterns and price trends, like Ooi, definitely can take advantage of the skill to anticipate price movement and time

their entry and exit. That is why Ooi always says “*Theory and practical are not the same in stock market...I am just interested in the trend and what the market wants,*” and “*it is not up to us to determine the market price, it is Mr Market.*” To him, it does not pay to argue with the market. Therefore, he always gives priority to the signals given by chart patterns. His strategy is to buy good stocks at the right time, not when they are near the bottom.

8.3.1 U = Uptrending stocks

“Big money is made in the stock market by being on the right side of the major moves. The idea is to get in harmony with the market. It’s suicidal to fight trends. They have a higher probability of continuing than not.”

Martin Zweig

As we know downtrend stocks can continue to go down. It can last a few months or a few years, and you will never know for sure when reversal will occur. Even buying stocks in sideways market will do you no good. The only way to ensure profitability is by buying uptrending stocks. This is the reason Ooi insists on looking for uptrending stocks in the first step of his screening process.

There are many ways to determine if a stock is on an uptrend. One of the methods is to look for the stocks with a rising price pattern, which shows a series of higher lows and higher highs. In other words, the share price reaches a higher low level and a higher high level than it did previously for a few times. Figure 8.3.1.1 and figure 8.3.1.2 show the pattern of higher lows and higher highs.

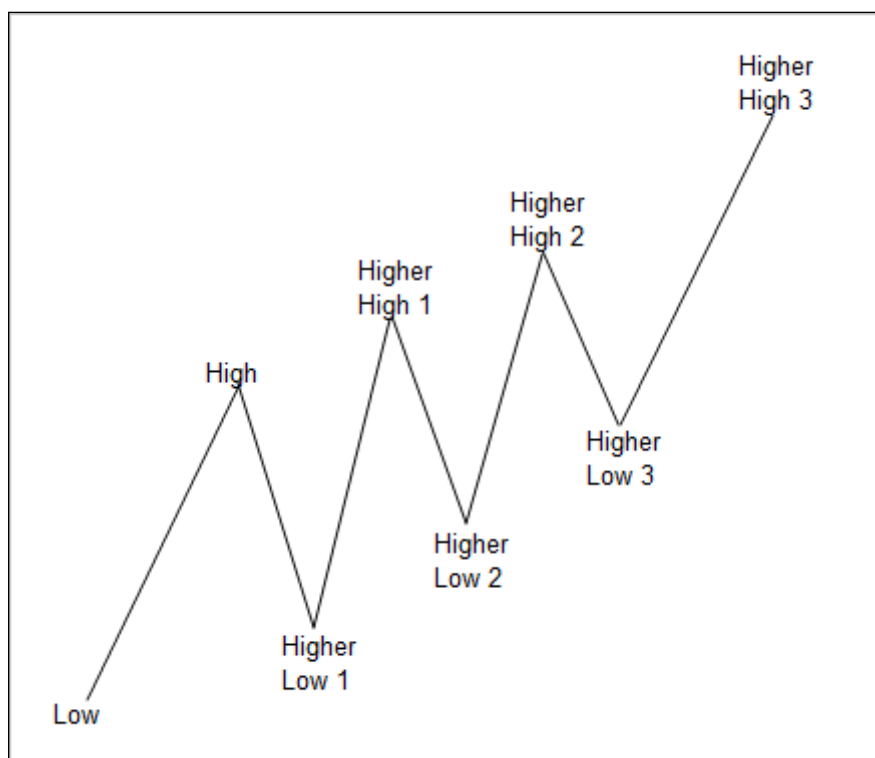

Figure 8.3.1.1: Higher lows and higher highs pattern

Figure 8.3.1.2: Share price of Yinson Holdings Berhad from December 2016 to January 2019
Source: ChartNexus

The second method is to find stocks with more bullish/green/white candlesticks than bearish/red/black candlesticks. According to Ooi’s observation, uptrend stocks tend to have two to five bullish candlesticks and a short bearish candlestick. Trade volume should be light during a healthy correction or decreasing gradually during a pullback. Figure 8.3.1.3 shows the candlestick pattern of Dayang Enterprise Holdings Berhad when the share price was on an uptrend. It can be seen from the chart that there were more green (bullish) candlesticks than red (bearish) candlesticks between early February, 2019 and early-March, 2019, when its share price was on an uptrend. Also, its trade volumes during corrections (or down days) were lighter than those during up days.

Figure 8.3.1.3: Share price of Dayang Enterprise Holdings Berhad from January 2019 to March 2019
Source: ChartNexus

The third method is to find stocks with share prices above their 200-day Moving Average lines, and at the same time their short-term Moving Average (MA) lines must be trending upward. Take, Figure 8.3.1.3, for example, the share price of Dayang Enterprise was in an upward movement when it crosses above 200-day moving average line on 7 February 2019. At the same time, its 20-day EMA (yellow coloured) line was also slopping up. Also, its share price was above its 20-day EMA line.

8.3.2 B = Breakout of resistance

“You should look for stocks making new price highs as they break out of price consolidation areas (or bases). Why? Because this is the point where most really big price advance begins, and is the time where the probability of a significant price move is the greatest.”

William O’Neil

The second step is to look for stocks breaking out of a consolidation area, breaking out from a stable base, or breaking above strong resistance. By doing so, investors do not have to hold the stocks in sideways market, which are going nowhere, in their portfolios for a very long period of time. According to Ooi’s observation, Malaysian stocks trend upward and downward 30% of the time, and go sideways 70% of the time. In term of risk-reward ratio, the expected return is greater than the risk investors have to bear by buying breakout stocks. Hence, the probability of making money is higher. Keep in mind that when a stock breaks above its resistance level, there must be a reason or an important development, which drives its share price higher.

That said, you should not confuse anticipating a breakout with buying after the breakout. In investing, Ooi does not like to buy based on what he anticipates to happen in the future, because no one knows when the breakout will happen, and there is a likelihood that it may never happen at all. This is the reason why Ooi insists on having the signal of a breakout from his system prior to performing fundamental analysis and determining the intrinsic value of the stock. Jesse Livermore once said *“it’s okay to mentally anticipate the action of the market, or a stock, but take no action until the market has confirmed that you are correct, by its action: Don’t anticipate market moves with your hard-earned cash.”*

Also, Ooi will look at the trade volume of the stock on the day of the breakout compared to its volume moving average (VMA) line. The reason is that if the trade volume on the breakout day is low, the breakout is more likely to be a fakeout or false breakout. A breakout in low volume is generally a bad sign, as buying interest, which breaks the resistance level, is not so great that the stock may go into correction very soon after the breakout when sellers come in to sell it down aggressively. That is why you should look for stocks that break out in high volume.

Figure 8.3.2.1: Share price of Magnum Berhad from October 2018 to March 2019

Source: ChartNexus

8.3.3 S = Sector in bullish mood

“In a bull market it is better to always work on the bull side; in a bear market, on the bear side.”

Charles Dow

In geography class, we learned that a rising tide can lift all boats. A bullish sector is comparable to a rising tide. If you want to select a stock that will go up in value, you need to make sure that it is in a booming industry so that it can make more money next year than this year. According to Bill O'Neil, *“the majority of leading stocks are usually in leading industries.”*

An investor can be safe in picking a financially strong company, or company with a steady stream of cash flow, but if he/she is wrong about the direction of the industry of the stock, he/she would not make money in his/her investment. That is the reason Ooi insists that the sectors of the stocks that he picks must be in bullish mood. He will quickly sell the stocks when he senses that the bear is around. And he will only come back when the bullish mood has returned.

In 2015, even though FBMKLCI was heading for a bear market, he advised his clients to buy V.S. Industry Berhad at Rm 2.33/share, as the industry was still booming and the sentiment of the industry was in a bullish mood. The stock eventually went up 904%. He and his clients made a lot of money out of the investment. In 2017, he went against the crowd again, and he advised his followers to buy the shares of Hengyuan Refining Company Berhad. According to him, Industry/Production Index continued to break new high in spite of the declining FBMKLCI. He asked them to ignore FBMKLCI, as the stock they bought into belongs to Industry/Production category, which was in bullish mood. Again, he was right, and he made more than 100% profit out of the bet.

The easiest way to judge if an industry or a sector is in bullish mood is by examining the 200-day SMA line of the industry or sector. The industry is considered to be in a bullish mood if its reading is above 200-day SMA line, and vice versa.

8.4 Second Screening Process: Fundamental Analysis

“Stocks fluctuate together, but prices are controlled by values in the long run.”
Charles Dow

Despite calling himself a chartist, he uses fundamental analysis in conjunction with technical analysis in his stock selection process. For instance, even if the outcome of his technical analysis on a stock indicates that its share price will be moving upward, he would not place his bet until the outcome of his fundamental analysis shows that the stock is worth buying. In this case, fundamental analysis acts as a safety net, which provides a downside protection for his venture, so that the risk of his portfolio is lowered to the lowest possible level. In addition, it allows him to estimate the upside potential of the investment, and to ensure that the risk-reward is skewed to the upside prior to committing his money. According to him, he only started to earn big money

consistently in the stock market after 2009, when he adopted both technical and fundamental analyses in his stock screening/picking process.

Without further ado, let us take a look at the important metrics of fundamental analysis that Ooi usually pays attention to in his stock selection process.

8.4.1 G = Growth of profit greater than 10%

Bill O’Neil once said “*There is absolutely no good reason for a stock to go anywhere in big, sustainable way if current earnings are poor.*” So, the key to making profitable investments is to ensure that stocks in your portfolio are companies with growth, which are generating more and more profit every quarter.

In order to do so, Ooi usually looks for stocks with the growth of profit greater than 10% in his screening process. Any stocks with profit growth rate lower than 10% will automatically be weeded out from his watch list. The reason why he does so is to select only proven stocks, which have delivered solid performance continuously rather than risking his money unnecessarily in some speculative stocks, which may tumble anytime when the market turns bearish. Moreover, the growing profits are a good catalyst, which may propel share prices upward when the market turns bullish.

There are two methods of searching for companies with profit growth greater than 10%. The first method is by comparing the annual profits of a company year-over-year (YoY). Let us use the data provided in the table below, Table 8.4.1.1, for illustration purpose. The annual profit of Company A in 2017 and 2018 were \$410 and \$463, respectively. In this case, the profit growth that Company A achieved in 2018 was 12.93%. The second method is by comparing the quarter profits of the same company year-over-year. For example, Company A made \$110 in Q4 Y17 and \$122 in Q4 Y18. In this case, the profit growth that Company A achieved in the Quarter 4 of 2018 was 10.91%.

Quarter	Year 2017	Year 2018	Change
Q1	\$ 100	\$ 113	+ 13.00%
Q2	\$ 95	\$ 110	+ 15.79%
Q3	\$ 105	\$ 118	+ 12.38%
Q4	\$ 110	\$ 122	+ 10.91%
Total	\$ 410	\$ 463	+ 12.93%

Table 8.4.1.1: Profits of Company A in 2017 and 2018

Whilst both methods can be used to determine the profit growth of a company, the first method is more suitable for use in judging the profit growth of defensive stocks, which are mostly non-cyclical in nature, such as utilities companies, fast food restaurants, non-durable goods producers, etc. The latter, on the other hand, is more suitable for use in determining the profit growth of cyclical stocks, such as oilfield services companies, semiconductor manufacturers, property developers,

and steel producers, as the changes or improvements can be spotted easily and quickly.

Note: make sure that all non-recurring items such as one-time profits or assets disposal gains are omitted from the profits before making comparison.

8.4.2 M = Margin of Safety greater than 30%

“The concept of a margin of safety is that an investor should purchase a security at a price sufficiently below his estimate of its intrinsic value that he will have protection against permanent loss even if his estimate proves somewhat optimistic. An analogy is an investor standing on the 10th floor of a building, waiting for an elevator to carry him to the lobby. The elevator door opens. The investor notices that the elevator is rated for 600 pounds. There already are two relatively obese men in the elevator. The investor estimates their weights at about 200 pounds each. The investor knows that he weighs 175 pounds. The investor should not enter the elevator. There is an inadequate margin of safety. Maybe he underestimated the weights of the two obese men. Maybe the elevator company overestimated the strength of the elevator’s cable. The investor waits for the next elevator. The door opens. There is one skinny lady in the elevator. The investor says hello to the lady and enters the elevator. On his ride to the lobby, he will enjoy a large margin of safety.”

Ed Wachenheim

Unlike most traders, who pay no attention to the intrinsic values of stocks yet aggressive, Ooi is cautious and careful with all his investments. He always says, *“It’s better to be safe than sorry.”* Whenever he invests his money in something, he makes sure that all his purchase prices are 30% below their intrinsic values. His chance of losing money, as such, is far lower than that of other people.

According to Investopedia, *“Intrinsic value is the perceived or calculated value of an asset, an investment or a company.”* In other words, it is the inherent value of the business. Any purchase price below this value is considered cheap. When share prices go far too low, they tend to move back up to this level, as investors rush in to scoop up the bargains. Hence, intrinsic value acts as a safety net to value investors in their investments.

There are many methods to determine the intrinsic value of a company. Some of the valuation methods Ooi uses include EV-to-EBIT ratio of Magic Formula, Actual Return-to-Expected Return ratio, Graham Number, Modified Graham Stock Valuation Formula, and Discounted Cash Flow.

Method 1: EV-to-EBIT ratio (EV/EBIT)

Enterprise value to earnings before interest and taxes (EV-to-EBIT or EV/EBIT) ratio is a form of valuation method, very similar to Price-to-Earnings (P/E) ratio, used to compare the relative value of different companies in the same industry and in the market. But, this method takes both equity and debt into account in the calculation, which is more comprehensive compared to P/E ratio.

According to Ooi, a company is considered cheap if its EV/EBIT value is below 8, and deemed overvalued if its EV/EBIT is higher than 12. Therefore, he always looks for companies with EV/EBIT multiple lower than 8, and then set his price target based on 12 times the EV/EBIT multiple.

Below is the formula of EV/EBIT

$$\frac{EV}{EBIT} = \frac{MarketCap + MinorityInterest + PreferredStock + Debt - Cash}{EBIT}$$

where

Market Cap = Share price × Number of shares,
EBIT = Net income + Interest + Taxes.

Method 2: Graham Number

Graham Number is a formula taught by Benjamin Graham, through his book called *Intelligent Investor*. The formula was developed to determine if a stock meets his requirements for defensive play. The formula takes both book value per share (BVPS) and earnings per share (EPS) data into account.

Below is the formula of Graham Number

$$GrahamNumber = \sqrt{22.5 \times EPS \times BVPS}, \text{ where}$$

EPS = Earnings / Number of shares

BVPS = Equity value / Number of Shares

When performing the screening work, Ooi looks for stocks with share price 30% lower than their Graham Numbers. For example, if the calculated Graham Number of a stock is \$1.00/share, Ooi would only give it a serious consideration if its share price is lower than \$0.70/share. The reason of doing so is to ensure that the stock is undervalued, and the room for decline is small.

Method 3: Discounted Cash Flow (DCF)

Amongst the above-mentioned valuation methods, Discounted Cash Flow (DCF) is the most popular one, as it takes future cash flows into consideration. Financially stricken companies with no ability to generate cash flow in the future will automatically be weeded out during the screening process. The analysis requires investors to estimate the present value of a stock based on its expected future cash flows using a discount rate (required rate of return for the riskiness of the cash flows).

For example, let us suppose that a fruit seller offers to sell you his fruit shop for Rm 500,000. The business can generate a fixed amount of Rm 100,000 cash flow stream every year for 10 years, and your expected rate of return is 5%.

We can use the basic formula of DCF to estimate the value of the business, and the formula of margin of safety (MOS) to judge whether the shop is worth your money.

$$DCF = \frac{CF_1}{(1+r)^1} + \frac{CF_2}{(1+r)^2} + \frac{CF_3}{(1+r)^3} + \dots + \frac{CF_n}{(1+r)^n}, \text{ where}$$

CF = Cash Flow,
 r = required rate of return.

$$DCF = \frac{CF_1}{(1+r)^1} + \frac{CF_2}{(1+r)^2} + \frac{CF_3}{(1+r)^3} + \dots + \frac{CF_{10}}{(1+r)^{10}}$$

$$DCF = \frac{100,000}{(1+0.05)^1} + \frac{100,000}{(1+0.05)^2} + \frac{100,000}{(1+0.05)^3} + \dots + \frac{100,000}{(1+0.05)^{10}}$$

$$DCF = \text{Rm } 772,173$$

$$MOS = 1 - \left(\frac{CP}{IV} \right), \text{ where}$$

CP = Current Price,
 IV = Intrinsic Value (or DCF in this case).

$$MOS = 1 - \frac{500,000}{772,173}$$

$$MOS = 35.25\%$$

From the calculation, we can tell that the business is worth Rm 772,173 and it is safe to buy the shop at Rm 500,000 from the fruit seller.

For experienced investors, if you want to determine the precise value of business, you may use the advanced formula of DCF, which includes terminal value, to estimate its value for the first five years and beyond.

$$DCF = \frac{CF_1}{(1+r)^1} + \frac{CF_2}{(1+r)^2} + \frac{CF_3}{(1+r)^3} + \dots + \frac{CF_n \times (1+g)}{(WACC-g)}, \text{ where}$$

CF = Cash Flow,
 r = Required rate of return,
 $WACC$ = Weighted Average Cost of Capital
 g = Perpetual growth rate

$$WACC = \left(\frac{E}{V} \times R_e \right) + \left[\left(\frac{D}{V} \times R_d \right) \times (1-T) \right], \text{ where}$$

E = Market capitalisation,
 V = Total value of capital (equity and debt),
 R_e = Cost of equity,
 D = Market value of debt,

R_d = Cost of debt,
 T = Tax rate.

R_e = Risk free rate of return + [Beta × (Market rate of return – Risk free rate of return)]
 R_d = (Risk free rate + Credit spread) × (1 – Tax rate)

8.4.3 F = Forecasted EPS is greater than current EPS

Ooi always says “*We should look at future growth rather than historical growth (of a company)*” The reason is that the stock market’s mechanism, like driving a vehicle, is a forward-looking mechanism. No one is able to drive by looking at rear-view mirror. Similarly, investors will not be able to make big money in the stock market by focusing on the historical growth data of a company. The data can only be used as guidance, and should not be used for estimating a company’s future value. Therefore, investors must learn to forecast the future earnings of a company, so that they always get themselves a head of the crowd.

In this process, Ooi looks for stocks with forecasted earnings (or EPS) greater than their current earnings (or EPS). New, hot and innovative products, superior services, change in management practice, growing demand of products, changes in currency exchange rate, pricing power, number of contract awards received and growing market share are amongst the areas where Ooi always focuses on, as they may bring higher revenue and profit to the companies.

For example, in 2015, after studying the business of V.S. Industry Berhad (V.S.), he told his clients that the earnings of V.S. would be growing exponentially, as the demand for V.S.’s product was very high. Below are his opinions on V.S., which he shared with his followers in 2015.

“V.S. has been supplying this coffee maker (GMCR) since the second half of 2014. It is the reason that the profit of Q1 2015 jumped up.”

“I believe this (GMCR) is a fantastic company with explosive earning growth in 2015. Please note that coffee consumption in the world grows 25% a year according to BFM 89.9. (In term of coffee consumption,) USA ranks No. 5, Japan ranks No. 6, China ranks No. 7, and India ranks No. 8. It is a big market for the coffee maker.”

“As long as there is no quality issue, GMCR will continue to order coffee making machines from V.S., the future earnings would then be very high. Hence, I can say V.S. is a fantastic company, and will be the star performer of 2015. If the joint venture between GMCR and Coca-Cola works well, the market is very big for this coffee maker.”

He was right that V.S.’s earnings would be growing at a rapid rate, and he made nearly 800% profit out of this deal.

In the same year, he also recommended a few export-related stocks such as Poh Huat and some furniture makers to his clients, as he believed that weak Ringgit Malaysia would benefit companies that export goods to the United States. Below is the extract of his opinion, which he shared with his followers, on the future earnings of export-related stocks.

“Look at the latest result of Pohuat. all export orientated stocks will do well because of the strong USD and weak RM.”

Again, he was right that the earnings of export-related stocks would be growing. He and his followers made a lot of money out of the investments.

Note that whilst high EPS and low PER (or P/E) is a perfect combination, sometimes Ooi would pay a slightly higher price for the profit growth potential if he believes that it is worth paying more for the stocks. He once said *“the stock market is always forward looking, high PER does not mean this stock cannot be a good buy. It is growth that matters most.”* The reason is that low PER stocks may get cheaper and cheaper if the stocks have no growth potential, or the companies are in sunset industries, or the businesses are going downhill. And, it seldom pays to put your hard-earned money in this kind of stocks.

8.5 Other Technical Indicators and Signals Ooi Would Monitor

Other than the screening criteria discussed above, Ooi also looks at several technical indicators for signals to support his buy decisions. Sometimes when any of the indicators shows that the time for hunting to is not ripe yet, he will wait at the sideline until the time arrives.

8.5.1 MACD crosses above its signal line

Amongst the technical indicators we discussed in Chapter 3, MACD is the most popular one, and is one of Ooi’s favourite indicators. The indicator does not only help identifying the direction of price trend, it also shows the momentum of the share price’s movement, whether it is strengthened or weakened.

He prefers to buy stocks (in his watch list) when their MACD lines cross above MACD Signal lines, especially when the MACD lines are above the level of zero. When the MACD line of a stock crosses above its MACD Signal line, it indicates that the stock is turned bullish. When the MACD line of a stock is above its centreline (or the level of zero), it shows that its fast-moving average (12-day EMA) line is above its slow-moving average (26-day EMA) line and the upside momentum is strong.

Figure 8.5.1.1: Share price of Thong Guan Industries Berhad from May 2016 to September 2016
Source: ChartNexus

Note that whilst he usually judges the bullish level or bearish level of a stock based on its daily MACD readings, sometimes, he would also look at its weekly MACD readings to determine if the bullish level or bearish level of the stock is still strong or weak.

8.5.2 Force Index colour changes from green to blue and the value is above zero

Whilst Relative Strength Index (RSI) is more popular amongst traders, Ooi prefers Force Index (FI) over RSI. The reason is that RSI will scare traders off when it is getting too high (above the level of 80). It will indirectly deter them from buying bullish stocks, especially when their prices are still shooting up like a rocket.

FI uses price and volume to determine the power of a price move. The stronger the share price move and the higher the trade volume, the higher the FI reading is. As the indicator takes volume into account, buying a stock when price breaks above its resistance level with a high FI reading would give Ooi a higher chance of making a winning bet and lower his probability of having a false breakout.

Ooi likes to buy stocks in his watch list when the FI reading of the stock changes from negative reading (green colour or below zero) to positive reading (blue colour or above zero). When the reading is above zero, it shows that the price upward move is strong with high buying pressure.

Figure 8.5.2.1: Share price of Uzma Berhad from Jan 2019 to April 2019

Source: ChartNexus

8.5.3 Stochastic Oscillator reading crosses above the level of 20

The indicator is usually used to ascertain if a stock is overbought or oversold, and to determine the momentum of price movement. A stock with Stochastic Oscillator reading above the level of 80 is said to be overbought. When its Stochastic Oscillator reading falls below the level of 20, the stock is considered oversold, and everyone is in fear.

Stochastic Oscillator chart generally contains two lines, namely %K and %D. %K is the current value of the Stochastic indicator, whilst %D is the fast Stochastic indicator, which is three-period moving average of %K. Investors can consider buying stocks in their watch lists when their %K line crosses above %D in oversold region, and when the %K crosses above the level of 20, as it is a sign of reversal.

Stochastic Oscillator is another favourite technical indicator of Ooi. He usually uses the indicator to determine the reversal of a price trend. He prefers to buy a stock (in his watch list) when its Stochastic Oscillator reading crosses above the level of 20, which is moment when the oversold stock reverses and moves upward.

Figure 8.5.3.1: Share price of Wah Seong Corporation Berhad from October 2017 to March 2018

Source: ChartNexus

8.5.4 Price breaks above 20-day EMA line

20-day EMA is the average price of a stock over the past twenty days, but places a greater weight to recent data. When share price of a stock breaks above 20-day EMA line, it shows that buying pressure is high, and buyers are willing to pay more to own the stock for some reason.

When Ooi buys a stock, he prefers to have the share price of the stock broken above its 20-day EMA line before buying it. The reason is that when share price breaks above 20-day EMA line, its momentum is strong, and it is likely to go higher and higher, which will indirectly reduce Ooi holding period of the stock, and give him a higher rate of return.

Since his average holding period of an investment is three to six months, the 20-period moving average fits his investment time frame, as it is not too short and not too long. It allows Ooi to stay in synchronisation with intermediate-term and primary trends, yet capture the movement when a stock begins to move upward.

Note that in a volatile market, share price may fluctuate along the 20-day EMA line.

8.5.5 20-day EMA crosses above 70-day SMA (Golden Cross)

I know what you may be thinking right now – have your finger on the buy button when the share price of a stock is about to break above the 20-day EMA line and buy the stock before Ooi builds his position.

Wait a moment! That is not the only signal he looks for before buying a stock. Sometimes, he would also wait for its 20-day EMA crosses over 70-day SMA, which is also known as (intermediate-term) Golden Cross, before buying it.

We have discussed in Chapter 3 that Golden Cross is a bullish breakout signal, which is formed when short-term moving average line crosses above long-term moving average line. Share price is likely to begin its upward rally when Golden Cross appears, as selling pressure has dried up, and buying pressure has gained higher momentum. Additionally, it indicates a change in trend, from either a sideways movement or a downtrend to an uptrend. Therefore, using the indicator in trading will increase your chance of making money. Also, the chance of having whipsaw trades, due to false signals, will be greatly reduced, as the signal is generated by two smoothed moving average lines.

According to Ooi “If the trend (of a stock) is strong enough, the 20-day EMA will cross above the 70-day SMA, and it is likely to continue its upward move.” For inexperienced investors, who always try to pick the bottom and ended up being trapped in sideways markets or downtrend stocks, the Golden Cross signal (20-day EMA crosses above 70-day SMA) is a powerful signal you should not ignore. The signal will ensure that your investment is, more often than not, in a profitable position. The chance of losing money in your investment will be reduced significantly.

8.6 Buying Strategy

No wise trader and investor will buy a stock at almost one price right at the beginning of the process with only one approach. The risk of losing big is high if one dashes into the stock market without testing the environment's temperature, and trades without a set of profitable strategies. Likewise, Ooi will not buy a stock in large quantity at one price with only one strategy. From my observation, he usually buys stocks in several orders at different prices, and with different methods. Below are some of his favourite buying strategies.

8.6.1 Buy on breakout

Ooi usually places his first order for a stock when breakout happens. The breakout can be a breakout of a congested zone, or a consolidation range, or a chart pattern. That is the point where resistance line is broken with weak bears overwhelmed by aggressive bulls.

The most common breakout pattern Ooi looks for is cup-with-handle pattern. The reason Ooi likes the pattern is that shaky hands are scared out and selling pressure will dry up during the formation of the pattern. He would then start buying when the resistance line of the cup-with-handle pattern (the right-hand side of the handle) is breached. In addition, he emphasises on an increase of volume during the breakout. The reason that a sharp increase of volume is so important is that it shows strong interest from buyers.

Another breakout pattern Ooi would pay attention to is breakout of range bound pattern, which is also known as consolidation range. A consolidation range is a channel contained by support and resistance lines, where share price moves up and down within the range. Ooi would usually buy a stock that meets his selection criteria when it breaks above the resistance level with high volume. The reason is that the breakout gives him an opportunity to capture a high-probability (major) upward price move at a very low downside risk. When the upper barrier is crossed with high trading volume, share price tends to move upward, as interest for the stock is so high that the limited supply could not meet the demand of the market. In Chapter 3, we have also learned that once share price breaks above the upper boundary, the resistance line will become a support level, which helps reducing the risk of losing money in the trade.

8.6.2 Buy near support level / buy on weakness

After his initial purchase of a stock, he might consider buying more shares if his original purchase has shown some profit, and if its share price still has plenty of room to grow. Of course, the stock must be undervalued when he considers adding more to his original position. He will buy it during a pullback (or short-term correction) at an area where support is strong and trade volume is low. In general, when the

primary trend of a stock is rising, buying it during a short-term pullback can be very rewarding.

I know you must be wondering why he insists on adding more only at support level or during a pullback. Well, according to Ooi, *“Share price cannot go up in a straight line, it needs a correction in order to purge weak holders so that the price can go up further.”* Moreover, the retracement provides an opportunity for investors who missed the train earlier on to buy at cheaper price before the resumption of the uptrend. Therefore, when the price of a stock has run up too fast, too high and too soon, he will not chase it. What he will do is to wait for a reaction and buy on weakness when the market is not too bullish. He tries to buy one tick above the support level. He always says *“Why would you pay more if you can get it at a lower price?”*

In addition to the support line/zone criteria, other factors he takes into consideration when determining if he should still add more shares to his existing position during a pullback includes

1. Fibonacci retracement must be above 50% (on daily chart)
2. Price does not break 3-month low (on daily chart)
3. More blue-coloured (bullish) candlesticks than red-coloured (bearish) candlesticks over the last three months (on daily chart)
4. Price must be above 20-week EMA (on weekly chart)
5. No three consecutive red-coloured (bearish) candlesticks (on monthly chart)

8.7 Selling Strategies

In the previous section, we have learned that knowing when to buy is important to protecting our capital, but it is more crucial to know when to call it quits. This is the secret of making big money in the stock markets, and it is particularly true for investing in Malaysia market. Every successful investor knows the importance of this theory and practices it religiously. Of course, Ooi is of no exception.

To Ooi, investing in stocks is like doing business. Shares are always regarded as merchandise. Therefore, he does not keep them in a vault. He would sell them if the stocks are deemed overpriced, or have no longer met his investing criteria. That being said, he does not sell it at almost one price. He would sometimes sell them when the stocks are still advancing, about to reverse, or have gone up too fast. If he believes that the stocks fail to meet his criteria, he would exit his positions immediately or even cut loss as soon as he found out the problem. That is the reason he always says *“buying stock is simple, but selling stock requires some skill.”* Below are some of his selling strategies.

8.7.1 Sell partially when share price has gone up too fast

“Repeatedly, I have sold a stock while it was still rising – and that has been one reason why I have held onto my fortune. Many a time, I might

have made a good deal more by holding a stock, but I would also have been caught in the fall when the price of the stock collapsed.”

Bernard Baruch

A wise investor will not allow greed to dictate his/her decision-making process. When a stock is overbought, it is probably a good time to realise some gain. Your cost will be lowered when you cash in the profit. In addition, your exposure to market risk will be reduced.

Ooi is very clear that his objective is to make money in the stock market, and that he will not lose much money for taking partial profit. Therefore, he would sell it into strength if a stock has risen too fast or too soon. He would then buy it back during correction if the uptrend is still intact.

The things he usually pays attention to are the movement of share price and trade volume. According to him *“Stock price will correct after it hits 100% gain.”* The reason is that there is some emotionalism involved in the price advance, and that smart money would have started to distribute their shares to late comers. Therefore, he would begin to realise some gain if any of his stocks has gone up too much from its base. Also, when the advance of share price is far greater than forty-five degrees, or when it spikes up, or has enormous move, it may be a time that he would take some profit off the table.

Of course, as a chartist, he also pays attention to technical indicators. For example, he would prepare to sell his shares partially if the stocks' Relative Strength Indicator or Stochastic Indicator is in the oversold territory for an extended period of time, especially when the trend momentum has started to show a sign of exhaustion. Also, he will look out for sell signals given by Parabolic SAR, Force Index, and MACD indicators.

8.7.2 Exit completely when a stock fails to meet his investing criteria

Ooi always says *“Buying shares must be slow, selling shares must be fast.”* If any of his stocks fails to meet his investing criteria, he would not hesitate to sell it. When it happens, he will dispose the stock immediately, even if the stock still seems strong.

“Sell when there is an abundance of over-optimism. When everyone is bubbling over with optimism and running around trying to get everyone else to buy, they are fully invested. At this point, all they can do is talk. They can't push the market up anymore. It takes buying power to do that.”

Jack Dreyfus

For example, if the share price of a stock has shot up too far above its intrinsic value, he would exit his position quickly, as there is too much extremism involved in the price advance. Of course, the share price

may go up further, but we cannot always sell at the highest price. It's very difficult to predict the market top. When the price of a stock is overshot to the upside, but its earnings fail to catch up, it is highly likely that the price will tumble as soon as the earnings report is released. Therefore, it is better to sell before the stampede begins. There is a Wall Street adage that says "*Bulls make money and bears make money, but pigs get slaughtered.*" The pigs are usually referred to those foolish people who dabble in the markets without knowing what is really going on.

Also, Ooi would exit his position if a stock delivers two quarters of decreased earnings. In his reply to one of his followers in mid-2015, he stated that "*There is no growth (in Naim). Hence I will not be interested in this stock. I selected it in early 2015 because its PER was low. The last two quarter (earnings) results were not good, hence I avoid it now.*" The share price of Naim Holdings Berhad fell from Rm 2.50 (in mid-2015) to Rm 0.80 (in 2019) after his disposal of Naim shares. If you are also a follower of Koon, you should have learned from Koon that EPS (or earnings) is the most powerful catalyst to move share price. When its EPS (or earnings) goes up, the share price will also go up. Likewise, when the EPS goes down, the share price will also go down. This is the reason Ooi folds his cards immediately when a stock fails to produce two quarters of increased earnings.

Further, Ooi will liquidate his position when the share price of a stock crosses below its 200-day SMA and major support line. Of all the moving average lines, 200-day SMA line is the most powerful one. It acts as a strong support for an uptrend stock. If the price of a stock reverses and crosses below the moving average line, it signifies that supply is greater than demand, and a downtrend or sideways market is likely to begin soon. You do not have to wait until 200-day SMA line turns down to sell your stock. You can do it immediately once its share price crosses below the moving average line.

8.7.3 Cut loss when his initial purchase fails

"The secret for winning in the stock market does not include being right all the time. In fact, you should be able to win even if you are right only half the time. The key is to lose the least amount of money possible when you are wrong. I make it a rule never to lose more than a maximum of 7% on any stock I buy. If a stock drops 7% below my purchase price, I will automatically sell it at the market – no second-guessing, no hesitation."

William J. O'Neil

Ooi always says "*There is no 100% sure win (investment) in the stock market.*" No matter how much due diligence we have performed in the early stage of the investing process, we are not invulnerable to cognitive and emotional biases, unpredictable bear attack, and any unforeseen matters. Therefore, he is prepared to cut his losses short,

always and without hesitation, if any of his initial purchases turn out to be a bad one.

“Why do most traders lose money? Because they would rather lose money than admit they’re wrong. What is the ultimate rationalization of a trader in a losing position? “I’ll get out when I’m even.” Why is getting out even so important? Because it protects the ego. I became a winning trader when I was able to say, “to hell with my ego, making money is more important.”

Marty Schwartz

He always set his cut loss point and criteria before he gets in. The reason of doing so is to have his investments decision be made unemotionally, and be as objective as possible. Pride and ego have no say whatsoever in his investment decision making process. When share price falls below his cut-loss point, he will press the brake immediately without arguing with the market. He understands that when the trend goes against him, he must fold his cards; there is no reward for arguing with the market.

“If you don’t bet, you can’t win. If you lose all your chips, you can’t bet.”

Larry Hite.

The reason that he cuts his losses early is to prevent them getting too large to give him a nightmare. Every big loss usually starts as a small loss, and then it grows bigger after a while. When the share price of a stock starts falling, it may go lower and lower, and no one knows how low it can go. That is why superinvestors follow the rules of cutting their losses short and letting their winners run religiously. They just have to take care of the downside; the upside will take care of itself. Ooi once said *“I expect a few losses in my investments. As long as those losses are kept at 10%, it is acceptable to me. It’s the overall return that counts. As long as my winning probability is maintained at 70%, any small losses won’t cause a significant damage to my portfolio.”*

Below are some of the stop loss rules he always uses

1. Cut loss if price crosses below 20-week EMA (on weekly chart),
2. Cut loss if price drops below 200-day SMA (on daily chart),
3. Cut loss if price drops below 10% of the original purchase price,
4. Cut loss if there is no earnings growth (YoY) over last 2 quarters.

“I will often sell a stock if it doesn’t go up shortly after I buy it. Even though it has not gone down, if the stock doesn’t do what I expected it to do, that’s reason enough to step aside and re-evaluate. When a stock you have bought falls below your purchase price, it is telling you have made an error – at a minimum in timing.”

Mark Minervini

Also, he would sell a stock, even at a loss, if its share price does not move within three months. He does not fall in love with any of his stocks. He believes that if a stock stays put after some time, there must be something wrong with the stock. He used the following metaphor to explain to his followers when being asked why he sold his stock at a loss.

“Just imagine that your horse is injured, do you think it still can run and be the champion? The answer is no,” and “when one of its legs is injured, the horse will never be able to win a race. We should replace it with a better horse.”

8.8 Use Elliott Wave Principle to Determine the Direction of Price Action

In order to determine the position he is in, and the direction of price action of his stock or the general market, Ooi, more often than not, applies Elliott Wave Principle in his analysis.

Elliott Wave is actually a share price pattern theory developed by Ralph Nelson Elliott in mid-1930s. According to Elliott, share prices of stocks usually move in certain repetitive patterns like ocean waves. Formation of the waves is mainly due to swings in investor's emotion, psychology, or behaviour.

The patterns can be divided into two main types, namely uptrend pattern and downtrend pattern. Each of the trend patterns can be broken down into five waves, namely Wave 1, Wave 2, Wave 3, Wave 4, and Wave 5. The trend patterns usually begin with Wave 1 and ends with Wave 5. Wave 1, Wave 3, and Wave 5 are impulsive waves, whereas Wave 2 and Wave 4 are corrective waves. In general, the corrective waves have three smaller waves, which are labelled as Wave A, Wave B, and Wave C. That said, sometimes the correction may get complicated, which would result in the formation of a flag pattern or descending channel, pennant, or sideways consolidation pattern. Therefore, you need to be flexible when analysing the pattern of a trend.

Figure 8.8.1: Elliott Wave pattern during bull market

Source: DailyFX

https://www.dailyfx.com/forex/education/trading_tips/daily_trading_lesson/2018/12/26/depth-of-elliott-wave-correction.html

Figure 8.8.1 shows the normal Elliott Wave pattern during a bull run. At the beginning of a new bull market, the formation of Wave 1 is usually not very obvious, as the public and media do not show much interest in the stock, except smart money. The stock will subsequently experience a retracement, which is known as Wave 2. Note that the lowest point of Wave 2 must not be lower than the lowest point of Wave 1. The percentage of the correction is generally between 38.2% and 61.8% of Wave 1's price difference. Depending on the situation of supply and demand, sometimes the retracement may be lower than 38.2% of Wave 1, and other times it may be higher than 61.8% of Wave 1, but it will not exceed 100% of Wave 1.

After the brief pullback, the stock will advance again. This impulsive wave is known as Wave 3, and is the strongest move amongst the three impulsive waves. The price difference of Wave 3 is generally 61.8% higher than that of Wave 1. Therefore, the highest point of Wave 3 is always above the highest point of Wave 1. During this time, a lot of sell-side analysts will begin to cover the stock and you will also see some talking heads discussing about the company's business and earning prospect. Therefore, the trade volume in Wave 3 will increase significantly, and is the highest one amongst the 5 waves.

Koon always says no stock can go up continuously in a straight line for whatever reason, after a while it must come down (either retrace or reverse). Wave 3 is usually followed by Wave 4, which is corrective wave. The percentage of the retracement is generally between 38.2% and 61.8% of Wave 3's price difference. Again, depending on the situation of supply and demand, sometimes the retracement may go beyond the range of 38.2% and 61.8%, but it will never be more than 76.4% of Wave 3. The next wave is Wave 5, which is also the final wave of an uptrend pattern. The length of Wave 5 is generally between 61.8% and 100% of Wave 3's length. That said, the length of Wave 5 may sometimes exceed 100% of Wave 3, if there are too much supply of money,

and if the market shows overconfidence in the stock, but it is always shorter than 161.8% of Wave 3's length. In comparison, the trade volume in Wave 5 is lower than that in Wave 3. This will result in a bearish divergence, rising prices with declining volumes. During this time, the shares of smart money have almost been distributed to those late comers, and the trend is about to reverse soon.

Note that the ratios of 14.6%, 23.6%, 38.2%, 50.0%, 61.8%, 76.4%, 85.4% and 100.0% are called Fibonacci ratios, which are discovered by Leonardo Fibonacci da Pisa in the 13th century. Elliott noticed the relationship between Fibonacci ratios, wave length, and mass psychology, and he recognised the importance of Fibonacci ratios when he studied the patterns of those waves. Therefore, he integrated the ratios into his Wave principle.

By arming himself with the knowledge of Elliott Wave Theory, Ooi can tell the direction of a stock or the market, where the price of a stock or the market is likely to go, and devise suitable strategies to capitalise on the price trend to maximise his return.

8.9 Investing Principles

You can have the above-mentioned stock selection criteria coded into your algorithmic trading system, and let your computer and smart-phone trade for you, but you would not be able to emulate the performance of Ooi if you do not understand his investing principles. It is the guiding principles, which Ooi spent a few decades to develop, influence the outcome of his investments. Therefore, we must also study the investing principles of Ooi in order to understand how he makes his investment decisions, and how he achieves the striking performance.

“If the investment game were all about numbers and calculations, then, in theory, given the computer programs available these days, you should be able to punch in the right criteria and make money all the time. It doesn't work that way.”

Thomas Kahn

8.9.1 Avoid stocks in downtrend market

According to Business Dictionary, downtrend is defined as “*Sustained downward movement in the price of an item or trading activity in an economy.*” The main cause is that the selling pressure of the item is greater than its buying pressure.

When a stock slides downward, there must be a good reason for the decline, and no one knows when the trend will reverse. There is a high possibility that the price may never return to your original purchase price. Therefore, Ooi always advises his clients to stay at the sidelines instead of pounding their hard-earned money down the rat hole when a stock is on a downtrend.

Whilst some “Kamikaze Warriors” believes falling knives very often beat the market by a wide margin, and consider catching the knives a rewarding attempt if done carefully, Ooi does not like the idea of buying shares when uncertainty is still high. He would rather wait for the dust to settle down before making any investment decisions on the counters.

8.9.2 Other metrics he would study

“It’s much easier to stay out of trouble now than to get out of trouble later.”

Warren Buffett.

Other than the main metrics of fundamental analysis discussed earlier, sometimes Ooi would also analyse the ability of a company in servicing its debt. In the world of business, debt is not a bad thing. Debt offers organisations plenty of benefits, which include but are not limited to investment and expansion opportunities, low financing cost, capital for day-to-day operation, lower taxable income, if people know how to tame the monster. Failure to manage it properly, on the other hand, will drag their stocks down and give investors a lot of troubles. Therefore, Ooi would examine the cash flow record of a company and its debt-to-equity ratio level, interest cost, net debt and liquidity ratio, in order to get a better picture of the company’s financial health before trusting his money to its management.

Also, Ooi would study the Return on Equity (ROE) and Return on Invested Capital (ROIC) of the company in order to assess the efficiency of the management in managing their capital and assets. The higher the figures, the higher the management’s efficiency is in allocating their resources. He prefers to buy highly efficient companies, which are able to produce ROE and ROIC higher than 10% and 12%, respectively. Of course, this is just a guideline and is not a hard-and-fast rule to determine if a stock is a good buy. Sometimes, he would purchase a stock even though its ROE and ROIC do not meet his target (i.e. stocks in cyclical industries) if he believes that the company’s business is booming, and is generating higher and higher cash flow.

8.9.3 Hardwork, hardwork, and hardwork

“The only way to gain an edge is through long and hard work.”

Li Lu

“If you don’t work very hard, it is extremely unlikely that you will be a good trader.”

Bruce Kovner

If you want to know the secret of Ooi making so much money in the stock market, the answer is hardwork. Hardworking may also be the best word to describe about him. He is a hardwork believer. He always

says hard work beats talent. He told his followers that *“I work 12 hours a day everyday on (studying) KLSE stocks alone, including weekend. Investing is what I am most passionate about. I do not want to miss any of the precious opportunities. I came from a very poor family, and earning money is very important to me. I also do not want my clients to lose money and opportunities,”* and *“writing the Weekly Market Outlook Report alone would take me more than 5 hours. I need to spend the whole Saturday or Sunday morning, locked inside my private room, to write it without anyone to disturb me. I treasure my reputation. I want to ensure that my report is value for (my clients’) money. It takes a lot of hard work and sacrifice. I hope all my subscribers will get the best out of me.”* Also, he always says he could not sleep well if his clients lose money. That is why he works so hard.

Another reason he works so hard is that he wanted to learn more and to improve his performance constantly. According to him, his made many mistakes during the 1997 Asian Financial Crisis, which nearly wiped him out. But it did not deter him from climbing back up. Quite the opposite, it lays the groundwork for him to improve his investing system further. Even though he is very successful today in investing, he continues to work hard so that he will not repeat those deadly mistakes.

Sometimes Ooi will read articles, and information provided by other people, but he will do the analysis, go through his checklist and study all parameters of the stocks, and make judgement himself. He always tells his followers *“You can listen to tips, (but) you must do your homework before you buy. It is your hard-earned money.”* Indeed, there’s no such thing as a free lunch. People, who listen to tips, take things for granted without performing their own obligatory due diligence always wind up losing money in the market. According to Jesse Livermore, *“In speculation and investment, success comes only to those who work for it. No one is going to hand you a lot of money... If there was any easy money lying around, no one would be forcing it into your pocket.”* He also said that *“Tips come from many sources – from a relative, a loved one, a pal who had just made a serious investment himself and want to pass on his expected good fortune. They also come from hucksters and criminals... often misleading articles are planted by people or brokers with hidden agendas, who want to sell their stock on the good news or they want to keep people invested while they go ahead and distribute their own stock.”*

8.9.4 Only buy stocks with high market liquidity

High liquidity is particularly essential to Ooi, who relies on both fundamentals and charts to make his buy and sell decisions. If the trend or the fundamental of a stock has changed unexpectedly, he must buy or dispose it immediately. Therefore, he needs the high liquidity nature of stock to get in and get out quickly, so that he does not lose money in the investment.

Unlike small investors, who can buy and sell a stock easily without causing a significant move in its share price, Ooi has a large sum of money under his management. Each time when he wants to buy and to sell his stock, he will have some difficulty building and closing his position if the market liquidity of the stock is low. For example, if the liquidity of a stock is low, he would have difficulty finding buyers without lowering his asking price when he sells the stock. Also, when he sells a stock, its share price will fall continuously. By the time he disposes all his shares, the price will be very low, and his average selling price will be reduced greatly. Hence, before buying a stock, he also looks at the record of its trade volume. If the liquidity is low, he would rather give it a miss. In 2017, he told one of his friends that *“Superlon passed my stock selection criteria. The only problem is the volume is too thin. I have many followers, it is difficult to get out when we want to sell.”* In that case, he could only watch the opportunity slipped through his fingers.

8.9.5 Patience is extremely important

“The big money is made by the sitting and the waiting – not the thinking. Wait until all the factors are in your favour before making a trade – follow the Top Down Trading rules. Once a position is taken the next difficult task is to be patient and wait for the move to play out.”

Jesse Livermore

In the previous chapter, we have learned that being patient is extremely important in investing. That is why Ooi always advises his followers to be patient. When the market sentiment turns bearish, he will advise them to close out their position, and when there is no opportunity to invest, he will ask them to wait at the sideline. According to Jack Schwager, investing and trading is likened to playing poker, *“You don’t just play every hand and stay through every card, because if you do, you will have a much higher probability of losing. You should play the good hands, and drop out of the poor hands, forfeiting the ante. When more of the cards are on the table and you have a very strong hand – in other words, when you feel the percentages are skewed in your favour – you raise and play that hand to the hilt.”*

“We do a lot of thinking and not a lot of acting. A lot of investors do a lot of acting, and not a lot of thinking.”

Lou Simpson

After buying a stock, Ooi will hold it, and wait for three to six months. And he always advises his followers to avoid getting in to and out of the market every day, and to avoid taking profit too early. When they trade too often, they do not only pay hefty amount of money in commission to their brokers, they also miss the opportunity to make big money when the stock moves upward in a significant way. Moreover, when they take profit too early, they give the opportunity for their

skilled counterparts to capture the large chunk of profit. That is why Ooi says *“The best thing to do is to avoid watching share price everyday.”* William Eckhardt once said, *“One common adage on this subject that is completely wrongheaded is: you can’t go broke taking profits. That is precisely how many traders do go broke. While amateurs go broke by taking large losses, professionals go broke by taking small profits. The problem in a nutshell is that human nature does not operate to maximise gain but rather to maximise chance of gain. The desire to maximise the number of winning trades (or minimise the number of losing trades) works against the trader. The success rate of trades is the least important performance statistic and may even be inversely related to performance.”*

8.9.6 Keep an open mind

“Those who stop learning get passed by.”

Whitney Tilson

“Those who cannot adjust to change will be swept aside by it. Those who recognize change and react accordingly will benefit.”

Jim Rogers

Whilst he possesses a set of rules to guide him in investing, Ooi understands that in order to stay profitable in the ever-changing market, he must evolve constantly. Therefore, he always keeps his mind open to new ideas, concepts, theories, and developments, and learns as many different investing strategies as he possibly can. He does not mind to learn from other young investors who have some special skills in investing, be it in value investing, momentum investing, income investing, dollar-cost averaging investing, growth investing, small-cap investing or socially responsible investing. He would study each of the investing methods and integrate the some of principles into his own approach. He always tells his followers *“You need multiple skills to win big in stock markets. Please do not confine yourself to a single skill. Just like playing basketball, you must be able to shoot with your left hand as well as your right hand. I don’t care if the cat is black or white, so long as it catches mice.”*

8.9.7 Use leverage to maximise gain

Despite being a prudent investor, Ooi understands that being too conservative will do no good to his investments. He tries to increase his gain when he is right and minimise his loss when he is wrong. Therefore, he would sometimes use leverage, such as margin loan and warrants, to maximise his overall return if he believes that the risk-reward ratio of his targets is skewed to the upside.

Whilst some investors believe that using margin finance adds unnecessary extra risk to their existing investments, and advise their peers to avoid it like the plague, Ooi thinks otherwise. According to him, using margin finance does not equate to getting a death sentence. It depends on the skills and discipline of an investor. He usually takes margin loan to invest when the market sentiment is bullish and will stop using it completely if the sentiment turns bearish. He limits his borrow to 50% of the purchase price of his marginable investments. Margin financing has helped him made a lot of money in the stock market. Therefore, he always says *“There is nothing wrong to use margin financing provided that you are proficient in using it. I have been using it for 25 years, and I am still in a financially sound position. But I don’t encourage investors to use margin finance if they do not have the necessary skills.”*

Below is his advice for people who consider using margin finance in their investments. *“Look at your trading history in last 5 years. If you are in a winning position, then you are qualified to use it. If you are still in a losing position, you are not encouraged to use it. Margin finance is like a machine gun, if you have the skill to use it, it is a very useful and effective tool. If you do not have the special skill to handle it, it will kill you and your love ones. Please learn the special skill and you must prove to yourself that you can make money from stock market consistently year after year before using it. Note that you cannot use margin finance in a bearish market, you will end up with a big loss. So, never use margin finance if the overall market is bearish. Use it only in bull market to maximize your gain. In addition, you should use margin finance for a short period of time only, and you should not keep your share under margin financing for 365 days. My advice is to avoid keeping your shares in margin account for more than three months. You must be disciplined if you want to use margin finance. If you do not have a good money management skill, please avoid using margin financing. Also, if margin of safety of your stock is less than 30%, you should not use margin loan for the stock.”*

Other than using margin loan, Ooi also trades warrants to maximise his return. When he buys warrants, he will look at the values of the warrants. According to his study, *“A warrant trading at a discount is one that nobody is interested in. In general, a warrant is ‘in the money’ when the stock it attached to is on a downtrend. Most of the times, no one is interested in the stock and warrant for a reason that we do not know.”* Therefore, he tries to shun those warrants trading at a discount to their underlying values and look for those trading at a premium to their stocks. In one of his replies to one of his follower, he said *“I do not care much about dividend, I aim for capital gain. Dividend is only a bonus to me. Generally, I like warrants trading at a premium; I do not like warrants trading at a discount. Warrants trading at a premium, most of the time, are the warrants with an uptrending stock and the stock must be very bullish.”*

8.10 A card up his sleeve - WuXing Theory and BaZi Astrology

Other than applying fundamental analysis and technical analysis, and having the ability to control his emotions and maintain discipline, Ooi also capitalises on his Chinese Astrology knowledge such as WuXing theory (the five basic elements: metal, water, wood, fire, and earth) and BaZi (the four pillars of destiny) to determine the most suitable periods of time and the best areas, when and where he should make his investments, in order to increase his chance of making winning bets.

According to WuXing theory, the five elements – metal, water, wood, fire, and earth – will interact with each other when they come in contact together. Two predominant effects produced by them are generating and overcoming effects. For example, water will nourish wood when rain water falls on plants, but it will extinguish fire when they come in contact together. The diagram below depicts how they interact with other elements and the impacts these elements will cause when they come in contact together.

Before Chinese New Year, Ooi would usually study Chinese Lunar Calendar, which is also known as JiaZi Calendar, to find out to which element the following year belongs and to which element each month in the year belongs. The objective of this study is to choose some suitable sectors, which are more likely to perform in the year or in certain months, for his investments in that particular year, and to determine which stocks should be removed from his portfolio.

Other than WuXing theory, he also studies his BaZi to find out his own destiny. By understanding his own potential, he can deploy his strategy wisely. Just like a cyclical business, every one of us will experience the inevitable ups and downs in life. Ooi believes that if he could reduce his losses to the lowest possible level in his down years, and maximise his returns with the use of leverage during good times, he would be able to amass a huge fortune in investment in his life.

Chapter Summary

- Ooi's investments have generated about 2,087% profit from 2013 to 2019.
- The secret recipe of Ooi's winning investments is having a suitable stock selection and investing system, which can help him make money consistently year after year and fits his investment style, and his ability to follow the system religiously.
- The system applies both technical and fundamental analyses in picking stocks.
- First screening process: Technical Analysis
 - ✓ U = Up-trending stock (share price must be above its 200-day SMA, and must demonstrate high lows and higher highs),
 - ✓ B = Breakout of resistance, and
 - ✓ S = Sector in bullish mood (sector index above 200-day SMA),
- Second screening process: Fundamental Analysis
 - ✓ G = Growth of profit must be greater than 10%,
 - ✓ M = Margin of Safety must be greater than 30%, (determined using EV/EBIT, Graham Number, or/and DCF), and
 - ✓ F = Forecasted EPS must be greater than current EPS.
- Other technical indicators and signals Ooi uses to support his buy decisions
 - ✓ MACD crosses above its signal line,
 - ✓ Force Index colour changes from green (below 0) to blue (above 0),
 - ✓ Stochastic Oscillator reading crosses above the level of 20,
 - ✓ Price breaks above 20-day EMA line, or
 - ✓ 20-day EMA crosses above 70-day SMA (a.k.a. Golden Cross).
- Types of buying strategy Ooi usually adopts
 - ✓ Buy on breakout, and
 - ✓ Buy near support level / buy on weakness.

Chapter Summary (Continued)

- Types of selling strategy Ooi usually adopts
 - ✓ Sell partially when share price has gone up too fast,
 - ✓ Exit completely when a stock fails to meet his investing criteria, and
 - ✓ Cut loss when his initial purchase fails.
- Ooi also uses Elliott Wave principle to determine the direction of a price action
 - ✓ There are two types of pattern, namely uptrend pattern and downtrend pattern,
 - ✓ Each of the trend patterns consists of five waves, namely Wave 1, Wave 2, Wave 3, Wave 4, and Wave 5,
 - ✓ Wave 1, Wave 3, Wave 5 are impulsive waves, whilst Wave 2, and Wave 4 are corrective waves.
- Ooi's investing principles
 - ✓ Avoid stocks in downtrend market,
 - ✓ Other metrics he would study - debt-to-equity (D/E) ratio level, interest cost, net debt, liquidity ratio, return on equity (ROE) and return on invested capital (ROIC),
 - ✓ Hardwork, hardwork, and hardwork,
 - ✓ Only buy stocks with high liquidity,
 - ✓ Patience is extremely important,
 - ✓ Keep an open mind, and
 - ✓ Use leverage to maximise gain.
- A card up his sleeve - WuXing Theory and BaZi Astrology.
 - ✓ By understanding his own potential and knowing which industries are likely to do well every year, he can deploy his strategy wisely.
 - ✓ The objective is to reduce his losses in his down years, and maximise his returns with the use of leverage during good times.
